Compare Different Approaches: Look for alternative methods in solutions to deepen understanding. Common Types of Questions in Linear ICs and Their Solutions Solved question papers often encompass a variety of question types, including theoretical, numerical, and application-based problems. Here, we outline common question patterns and their solutions.

1. Basic Conceptual Questions Example: Explain the operation of an operational amplifier in an inverting amplifier configuration. Solution: An operational amplifier (op-amp) in an inverting amplifier configuration uses a resistor (R_{in}) connected from the input signal to the inverting input terminal, with the non-inverting terminal grounded. The output is fed back to the inverting input through a feedback resistor (R_f). The circuit amplifies the input signal with a gain determined by the ratio of R_f to R_{in} , specifically: $V_{out} = -\frac{R_f}{R_{in}} V_{in}$. This configuration inverts the input signal and amplifies it according to the gain ratio.
2. Numerical Problems on Voltage Regulation Example: Design a voltage regulator circuit using an LM317 to provide an output of 5V. Calculate the resistor values needed, given that the reference voltage is 1.25V. Solution: The LM317 voltage regulator uses the formula: $V_{out} = V_{ref} \left(1 + \frac{R_2}{R_1}\right) + I_{adj} R_2$. Assuming I_{adj} is negligible, $5V = 1.25V \left(1 + \frac{R_2}{R_1}\right)$. $\Rightarrow \frac{R_2}{R_1} = \frac{5V}{1.25V} - 1 = 4 - 1 = 3$. Choosing $R_1 = 220 \Omega$, then $R_2 = 3 \times 220 \Omega = 660 \Omega$.
3. Frequency Response and Filter Design Questions Example: Design a low-pass active filter with a cutoff frequency of 1 kHz using an op-amp. Solution: Using a simple RC low-pass filter, the cutoff frequency (f_c) is: $f_c = \frac{1}{2\pi RC}$. Choose $R = 10k\Omega$, then: $C = \frac{1}{2\pi R f_c} = \frac{1}{2\pi \times 10^4 \times 10^3} \approx 15.9nF$. Select a standard capacitor value, e.g., 16 nF, and set the resistor accordingly.
